

Pythia-14M controls under uniform TEAL-style post-hoc clipping

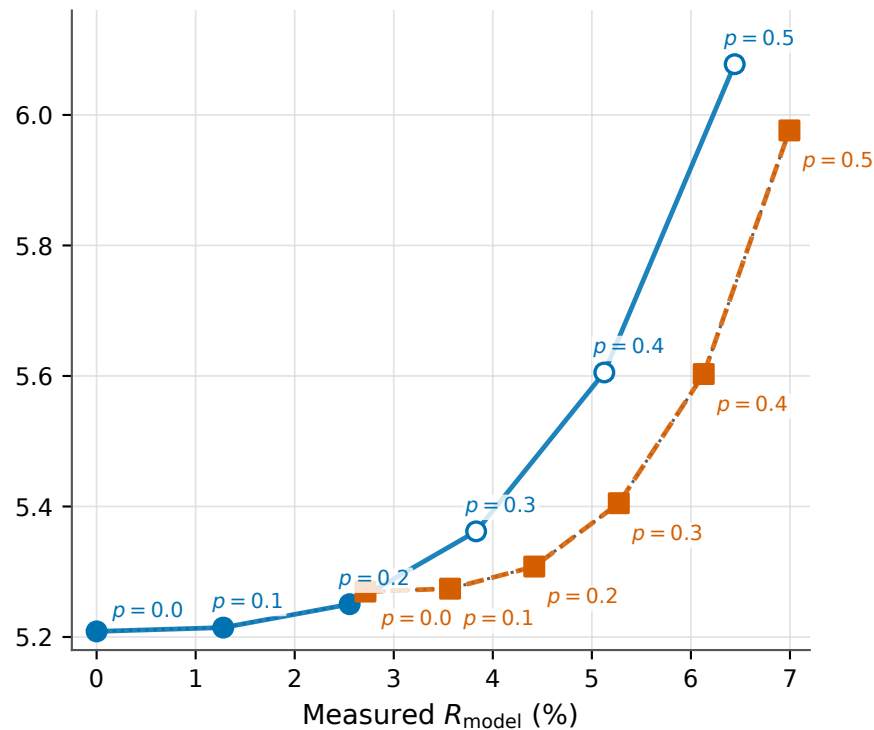

Per-matrix thresholds calibrated on 10 training blocks; all 338 validation blocks evaluated

—●— GelU control + TEAL -■- ReLU control + TEAL ...●... Global nondominated envelope

(a) Complete target-sparsity sweep

(b) Low-loss detail

Labels give uniform target sparsity p . Filled points lie on the global nondominated envelope; open points are dominated. Lines connect increasing targets only. R_{model} is exact-zero logical-product opportunity, not measured speedup; one seed.
